kurtosis	-1.2	-0.60751	0.086901	-0.09749	-1.08858	-0.470723	-0.239837
skew	0.0	-0.132649	0.162611	0.204164	0.282308	0.313576	0.8067

Kurtosis of the placement dataset which ["ssc_p"] ["hsc_p"] ["degree_p"] ["etest_p"] ["mba_p"] ["salary"] has the value of Kurtosis as **-0.60751, 0.086901, -0.09749, -1.08858, -0.470723, -0.239837 respectively means kurtosis (flat<3) so its curve comes as **platykurtic** and distribution is flatter with lighter tails for that case it has fewer outliers .

*** Skewness of the placement dataset which ["ssc_p"] has the value of Skew as **-0.132649** means **(LeftSkew<0)** so its curve comes as left skew or **Negative skewness** and shape of distribution is changed with skew shifted to left .

*** Skewness of the placement dataset which ["hsc_p"] ["degree_p"] ["etest_p"] ["mba_p"] ["salary"] has the value of Skew as **0.162611, 0.204164, 0.282308, 0.313576, 0.8067** respectively means **(RightSkew>0)** so its curve comes as **right skew or Positive skewness** and shape of distribution is changed with skew shifted Right

Kurtosis and Skewness

⚙ In summary

Property	Low Value	Normal Value	High Value	📄
Skewness	Left skew (<0)	Symmetric ($=0$)	Right skew (>0)	
Kurtosis	Flat (<3)	Normal ($=3$)	Peaked (>3)	

So, this chart visually shows how the **shape of a distribution changes** with **skewness** (shifted left/right) and **kurtosis** (flatter/peaked).

💡 Kurtosis (Right Side of Image)

Kurtosis measures the “**peakedness**” or **tailedness** of the distribution.

1. Kurtosis = 3 (Black curve) → Mesokurtic
 - Normal distribution shape (standard bell curve).
2. Kurtosis > 3 (Blue curve) → Leptokurtic
 - Distribution is **more peaked** with **heavier tails**.
 - More outliers.
3. Kurtosis < 3 (Red curve) → Platykurtic
 - Distribution is **flatter** with **lighter tails**.
 - Fewer outliers.
